

The graph above shows the number of productions by each of the top three U.S. networks over time. We notice the overall dominance of CBS, followed by NBC, then ABC. There is a spike in all three networks' output during the 1950s and again in the 2000s.

The number of movies decreases exponentially with cast size. The vast majority of movies have a cast size less than 20. The nearly 300,000 "movies" with a cast size of 1 (which is the mode of the distribution) may actually be TV shows hosted by a single person.
